1 The Gradient Papers — Series Index (v3)

> *"Models are smarter together than apart; consensus and learning are the same process; and a network that learns by reaching consensus will outperform any network that treats intelligence and agreement as separate concerns."*

The Gradient Papers are an eleven-part working dissertation (plus this index) documenting the **Citrate Network**, an AI-native Layer-1 BlockDAG built on the thesis that distributed learning and distributed consensus are the same problem under different names. They are authored by **Larry Klosowski and Lauren Mendenhall** and published by **Citrate Inc.**

This **v3** revision was written in August 2026 against the live chain-id 40204 testnet. Every mechanical claim is traceable to a file path or a deployed contract address in the canonical repositories. Where a claim is a target, a hypothesis, or not-yet-built, the paper says so.

1.1 What changed from v2, and from the April 2026 draft

There were two prior generations. **v2** (February 2026) was the substantive, full-length set. An **April 2026 draft** (also labelled "v3") added Paper X but compressed every paper to roughly a third of its length and left its evidence audit unfinished. This definitive v3 treats **v2 as the length and substance anchor** and updates it to current reality, rather than polishing the thin April draft.

The material changes in this generation:

- **Every claim re-anchored** to a current `file:line` or a 40204 contract address, re-verified rather than inherited. Several stale parameters were corrected against the running chain (chain-id is 40204, block time is ~2 s on testnet, the BFT checkpoint interval is 50 blocks).
- **Organizations scrubbed to Citrate Inc.** The former publisher/affiliation lines (a foundation, a separate health company) are removed; the subject concepts (the BR1J DAO, the Mozi Cooperative) and the cnidarian *biology* of Paper IX are kept, as are all third-party academic citations.
- **Authorship** is Larry Klosowski and Lauren Mendenhall on all twelve, with a standard AI-assistance disclosure in each Acknowledgments section rather than an AI co-author byline.

- **NAT joins the series as Paper XI**, the strongest "we actually built it" artifact.
- **Honesty upgrades and one major correction:** Paper VI's NFT bridge was never deployed and is now documented as a superseded design, with the implemented money-path (a wrapped token, a market-maker, a price feed) put in its place; Paper XI's results are framed as registered non-inferiority with the larger-scale widening left explicitly unresolved; Paper X's zero-knowledge verifier is flagged as shipping off by default; and Paper V is kept honestly theoretical, with no prototype built.

Honesty principle. v3 cites the testnet's actual state. Where v2 leaned on aspirational language, v3 says "this works today," "this is specified," or "this is conjectural," and a reader can audit each claim against the linked code.

1.2 Paper inventory (v3 status)

#	Title	v3 status	Lead anchor
0	Series Index (this)	—	`gradient-papers/`
I	Citrate: Protocol Specification for an AI-Native BlockDAG	**Verified** (testnet 40204)	`core/consensus/src/ghostdag.rs:54`; 39 contracts
II	Paraconsistent Consensus	**Implemented**	Belnap precompile `0x0110` (`q16/belnap.rs:77`)
III	The Mentorship Protocol	**Implemented** mechanism, **Hypothesis** outcomes	`LearningPool 0xfc514b82`, `LoRAFactory 0x6e564d22`
IV	Behavioral Issues (BDD as methodology)	**Practiced**	codified as the Agentile framework
V	ATIS: Analog Token Importance Scoring	**Theoretical** (no code, honest)	external hardware only
VI	The Memetic Money Portal	**Partially Implemented**	`WrappedSALT 0xaa918302` + market-maker + oracle
VII	The Mozi Cooperative	**Implemented** accounting, **Specified** suite	`ContributionAccounting 0xcdd24773`
VIII	The BR1J Constitution	**Implemented** governance	`TreasuryGovernor 0x62e268f2`
IX	The Medusa Paradigm	**Specified + Practiced** (design inspiration)	`NematocystSlashing 0xfeb23abd`
X	The Substrate of Verifiable Inference	**Implemented**, feature-gated	`zkp/halo2/mod.rs:199` (behind `halo2-substrate`)
XI	The Neuroarchitectural Transformer (NAT)	**Implemented**	15 crates; 8 TLA+ specs TLC-green

Three maturity tags carry evidence: **Verified** (on-chain or audited), **Practiced** (a methodology in active use), **Implemented** (code in `main`, exercised by tests). **Specified**, **Hypothesis**, and **Theoretical** mark, in decreasing order, what is designed, conjectured, or purely proposed.

1.3 Reading paths

Audience	Recommended order
Engineers	I → X → XI → IV → II → III
Researchers	XI → II → V → X → III → I
Investors	I → VI → VII → VIII → II
Operators	I → IV → X → IX → VIII
Community	VIII → VII → VI → IX → I

The architecture reads either bottom-up (I → XI) or top-down (XI → I). Paper IX (the biological inspiration) is placed last on purpose: the engineering should stand on its own before the analogy is appreciated.

1.4 The series thesis, restated

A blockchain is a system for many machines to agree on a single view of truth. A learning network is a system for many machines to converge on a single, or richer, representation of the world. These are the same shape: both are gradient-descent processes in disguise, one over disagreement (slashing-driven equilibrium), one over loss (training-driven equilibrium). v3 makes that identity load-bearing, every paper that claims to "do learning" points at a contract that records contribution, and every paper that claims to "do consensus" points at a finality mechanism that treats disagreement as data. The series argues that the next generation of distributed intelligence will be built by networks that do not separate consensus from cognition. Citrate is the first attempt to build one.

1.5 Living-document protocol

The v3 papers are not frozen. Each carries a `status` and a `maturity` in its header, and a claim moves from draft toward *active* only when its claims either cite current code or are tagged as hypothesis. The canonical home for the series is `citrate-labs/gradient-papers/` (Markdown source of truth, a shared arXiv LaTeX build, and rendered PDFs); the four older mirrors are superseded and should point here. A companion media layer (`media/`) retells each paper as a 3–5 minute layman story in two formats.

1.6 Authorship and honesty

The Gradient Papers are written by Larry Klosowski and Lauren Mendenhall, published by Citrate Inc. Drafting and literature triage were assisted by AI systems; every mechanical claim was verified by the authors against the referenced source and the deployed contracts on chain 40204. The opinions in the closing sections of each paper are the authors' honest assessment of where the work stands, a record of what we know, and of what we know we do not yet know.

This paper is part of the Gradient Papers series, published by Citrate Inc. Correspondence: Larry@citrate.ai
